Math

Math in Bash base

Arithmetic operations in bash can only be performed on integers.

```
1 $(( INT OPERATION_TYPE INT))
2
3 # Ex 1: simple addition
4 username@hostname:~$ echo $(( 2 + 2 ))
5 4
6 username@hostname:~$ foo=$(( 2 + 2 ))
7 username@hostname:~$ echo $foo
8 4
9 username@hostname:~$ echo $(( $foo + 2 ))
10 6
```

Math in Bash operation type

The operations type are :

- addition : +
- substration : -
- multiplication : *
- division : /

Round in bash math

Bash rounds the result of operations “down” to get an integer.

```
1 username@hostname:~$ echo $(( 9 / 3 ))
2 3
3 username@hostname:~$ echo $(( 10 / 3 ))
4 3
```

Bc

If you need to perform arithmetic operation with float you need `bc` with its scale option :

The syntax is as follows:

```
1 username@hostname:~$ echo "scale=3;10/3" | bc
2 3.333
3 username@hostname:~$ echo "scale=2;10/3" | bc
4 3.33
5 username@hostname:~$ echo "scale=1;10/3" | bc
6 3.3
```

Sequences

Sometimes it's useful to generate a sequence of integers from a start to an end point. You can use the `seq` command to do so.

Example :

```
1 username@hostname:~$ seq 1 10
2 1
3 2
4 3
5 4
6 5
7 6
8 7
9 8
10 9
11 10
```

The flows

Each process has 3 flows :

- The input stream "*stdin*"
- The standard output stream "*stdout*"
- The error output stream "*stderr*"

Stdin

This is an invisible but very useful feed. It's an input data of a command, generally from the keyboard or from another command.

Figure 1: Flux Linux

Stdin (example)

Read from the keyboard gradually:

```
1 username@hostname:~$ sort << ENDSORT
2 > toto
3 > titi
4 > tata
5 > ENDSORT
6 tata
7 titi
8 toto
```

Terminal wait for some text. As long as the character string != keyword (here ENDSORT), continue. All data sent to `sort` until ENDSORT keyword detected. The result `sort` will be in its stdout. We can modify the stdout :

```
1 username@hostname:~$ sort << ENDSORT > file_sort.txt
```

Stdout

This is the most visible flow. By default, it will be displayed on the screen.

It is possible to :

- send it in a new file : `cmd > file`
- send it at the end of a file : `cmd >> file`
- send it to another command to make a chaining commands : `cmd1 | cmd2` (the stdout of `cmd1` will be the stdin of `cmd2`)

Stdout example (1/2)

```
1 username@hostname:~$ echo "this is my stdout"
2 this is my stdout
```

Stdout example (2/2)

```
1 username@hostname:~$ echo -e "toto\ntata" >> File.txt
2 username@hostname:~$ cat File.txt
3 toto
4 tata
5 username@hostname:~$ cat File.txt | grep "to"
6 toto
7 username@hostname:~$ cat File.txt | grep "to" | wc -l
8 1
```

Stderr

This is the flow that the terminal displays during an error. For this flow it is possible to :

- send it in a new file : `cmd 2> file`
- send it at the end of a file : `cmd 2>> file`
- send it to stdout : `cmd 2>&1 > file` or `cmd &> file` (the set of stderr and stdout will be in *file*)

Stderr (example)

```
1 username@hostname:~$ ls
2 File
3 Directory
4 username@hostname:~$ cat FileNotExist
5 cat: FileNotExist: No such file or directory
6 username@hostname:~$ cat FileNotExist 2> ./stderr.txt
7 username@hostname:~$ cat FileNotExist 1> ./stdout.txt
8 username@hostname:~$ cat stderr.txt
9 cat: FileNotExist: No such file or directory
10 username@hostname:~$ cat stdout.txt
11
12 username@hostname:~$
```

ReGex

The different types

ReGex allow you to match specifics patterns (like a phone number, an email address ...)

There are 2 types of regular expressions :

- Basic regular expressions (vi, grep, expr, sed) : ERb
- Extended regular expressions (grep -E, egrep, awk) : ERe

The keywords of the regex

- “^” = Start of line : “^toto”
- “\$” = End of line : “toto\$”
- “.” = Any character
- “?” = 0 or 1 time the previous character or grouping : “?t”
- “*” = 0 to n times the previous character or grouping : “*t”
- “+” = 1 to n times the previous character or grouping : “+t”
- “\” = Protection of a special character
- “[list_of_chars]” = A quoted character in the list : “[a-z]” “[A-Z]” “[0-9]”
- “[^list_of_chars]” = A character that is not mentioned in the list : “[^0-9]”
- “(PATTERN){n}” = Number of times of patern (ERe) : “(ti){2}”

Example of ReGex (1/3)

Let's take this text file as an example :

```
toto likes titi
Isen 2021
Toto likes titi
```

- Find lines that start with toto and end with titi

```
1 isen@isen : cat exampleRegex.txt
2 toto likes titi
3 Isen 2021
4 Toto likes titi
5 isen@isen : grep "^toto.*titi$" exampleRegex.txt
6 toto likes titi
```

Example of ReGex (2/3)

- Find lines that start with a capital letter

```
1 isen@isen : cat exampleRegex.txt
2 toto likes titi
3 Isen 2021
4 Toto likes titi
5 isen@isen : grep "[A-Z]" exampleRegex.txt
6 Isen 2021
7 Toto likes titi
```

Example of ReGex (3/3)

- Find lines that contain “to” 2 times

```
1 isen@isen : cat exampleRegex.txt
2 toto likes titi
3 Isen 2021
4 Toto likes titi
5 isen@isen : grep -E "(to){2}" exampleRegex.txt
6 toto likes titi
```

Grep

Introduction

Grep command can be used to find or search a regular expression or a string in a text file.

Searching in a specific file

Searching the pattern “Toto” in the file exempleRegex.txt.

```
1 isen@isen : grep "Toto" exempleRegex.txt
2 Toto love titi
3 Totope
```

Searching recursively

Searching the pattern “Toto” recursively in all files in /home/isen directory and sub directory.

```
1 isen@isen : grep -r "Toto" /home/isen
2 Toto love titi
3 Totope
4 Toto hate titi
```

Ignore case sensitivity

Searching the pattern “toto” by ignoring case sensitivity in the file exempleRegex.txt.

```
1 isen@isen : grep -i "Toto" exempleRegex.txt
2 Toto love titi
3 Totope
4 toto tata
5 TOTO titi
```

Sed

Introduction

Sed is a command that allows manipulation of text file from regular expression.

By default sed displays the result in the stdout. To do the action directly in the file you need the option **-i**.

Substitution

Change one pattern by another.

```
sed "s/PATTERN_TO_LOOK_FOR/REPLACEMENT_PATTERN/"
```

```
1 isen@isen : cat exempleRegex.txt
2 toto likes titi
3 Isen 2021
4 Toto likes titi
5 isen@isen : sed "s/titi/loic/" exempleRegex.txt
6 toto likes loic
7 Isen 2021
8 Toto likes loic
```

Insert

Add a line before the wanted pattern.

```
sed "/PATTERN_TO_LOOK_FOR/iPATTERN_TO_ADD/"
```

```
1 isen@isen : cat exampleRegex.txt
2 toto likes titi
3 Isen 2021
4 Toto likes titi
5 isen@isen : sed "/Toto/iTiti" exampleRegex.txt
6 toto likes titi
7 Isen 2021
8 Titi
9 Toto likes titi
```

Append

Add a line after the wanted pattern.

```
sed "/PATTERN_TO_LOOK_FOR/aPATTERN_TO_ADD/"
```

```
1 isen@isen : cat exampleRegex.txt
2 toto likes titi
3 Isen 2021
4 Toto likes titi
5 isen@isen : sed "/toto/aTiti" exampleRegex.txt
6 toto likes titi
7 Titi
8 Isen 2021
9 Toto likes titi
```

Delete

Delete a line containing a pattern (by modifying permanently the file with **-i** option).

```
sed "/PATTERN/d"
```

```
1 isen@isen : cat exampleRegex.txt
2 toto likes titi
3 Isen 2021
4 Toto likes titi
5 isen@isen : sed -i "/titi$/d" exampleRegex.txt
6 isen@isen : cat exampleRegex.txt
7 Isen 2021
```
